Pending Nucleic Acid and/or Pending Amino Acid database searches now generate two sets of results. These databases were split into to two parts to reduce the time needed to update the databases daily. The split freed up more machine time for processing searches.

Searches run against the Nucleic Acid Pending database produce two sets of results, with the extensions, .rnpm and .rnpn
Searches run against the Amino Acid Pending database produce two sets of results, with the

extensions, .rapm and .rapn

The Pending database search results should not be left in the case because they contain data that is confidential.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

It currently consists of 28 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                      Center: Washington University Genome Sequencing Center

Ramataki,T.
Six-base deletion occurring in messages of human cytochrome P-450
in the CYP2C subfamily results in reduction of tolbutamide
                                                                                                                                                                                                                      GenBank staff at the National Library of Medicine created this entry (NCBI gibbsq 117179) from the original journal article. This sequence comes from Fig. 1.
Author also gives sequence for another cytochrome P-450 that contains a 6-base deletion of nucleotides 783-788.

No. is the number of results predicted by chance to have a source greater than or equal to the score of the result being printed, and is derived by analysis of the cotal score distribution.
                                                                                                                                                                                                           US-09-763-292-3

```

between regions of nucleic acids that were separated by intervening sequence, and also for determining boundaries present in genes containing group 1 type introns such as Tetrahymen TRNA, where self-splicing occurs in the presence of guanosine octotror. The present sequence is human cycochrome P450 (CTP450) 2C19 gene related to the invention.

8\$33333

Sequence 8437 BP; 2392 A; 1501 C; 1541 G; 2654 T; 349 other;

```
Determining structure of genes whose sequence is not known from cDNA, by sequencing the gene or gene across exon-intron boundaries using evenly spaced primers comprising nucleic acids that hybridize to the cDNA of gene

The present invention relates to a method for determining gene structure when the general sequencies using method involves sequencing the gene across expointed is minor. The method involves sequencing the gene across expointion boundaries using evenly spaced primers or tiled primers comprises uncleic acids that hybridise to the known coNA sequence of the gene at about 100:300 base intervals and the gene comprises the template. Gene structure can be decrained without the need to sequence the entire gene. The method provides information necessary to determine gene structure and phenotypic gene or fragment. The methods are useful in germline sequence variation analysis. The method is also useful for determining the boundaries Claim 23; Fig 5; 81pp; English.

1-concoding regions but contained 2 single base changes at positions (197) and (142). One of these base changes as conservative but the other (197) and (142). One of these base changes as conservative but the other clones 29c and 60 buffer by one nucleotide in the coding region.

Clones 29c and 60 buffer by one nucleotide in the coding region.

Clones 29c and 60 buffer by one nucleotide in the coding region.

Clones 29c and 60 buffer by one nucleotide in the coding region on solution is signal 21 bases from the poly A tail. One 60 buffer an unusually long 3'-noncoding region containing three possible containing three possible containing three possible containing three possible and a polyadenylation signals with no poly A tail. The differences in the 3' concoding regions could represent alternate splicing, allelic containing three possible coding regions could represent alternate splicing, allelic containing three coding regions the streams are more and a coding region. They are most smill three coding region they are most smill to 209 (82% amino acid homology) Of the 50 clones encoding 209, only two allelic variants were of the 209 clones were identical with clone 65, and 11 were 10 oith clone 25. Clones 25 and 65 are identical in the 5' and New isolated cytochrome P450 2C subfamily member identifying drugs metabolised by S-mephenytoin 4' activity and to develop other screening assays De Morais SMF, Goldstein JA, Romkes-Sparks M; (USSH ) US DEPT HEALTH & HUMAN SERVICES. The present sequence encodes a fusion proteins comprising a portion of a abacterial organization of a mammalian cytochrome P450 protein and also a portion of a mammalian cytochrome P450 protein. The fusion protein can oxidise hydrocarbons or any compound having a carbon-hydrogen bond. The fusion protein can be used for hydroxylating a compound to be oxidised. It can also be used in the bioremediation of an environmental pollutant. Since the fusion the bioremediation of an environmental pollutant. Since the fusion protein is soluble, it can be subject to structural elucidation by X-ray expressed in soil bacteria to facilitate bioremediation.
Bacterial and mammalian chimeric cytochrome P450 protein encoding DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New P450 fusion proteins - comprising a portion of a bacterial cytochrome P450 protein and a portion of a mammalian cytochrome P450 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Bacterial; mammalian; cytochrome P450; chimeric; fusion protein; oxidise; hydrocarbon; carbon-hydrogen bond; hydroxylating; bioremediation; environmental pollutant; ss.

This polypeptide is used in a method to screen for a drug that is setabolised by a cytochrome P450 having 5-mephenytoin that is setabolised by a cytochrome P450 having 5-mephenytoin a surageaic, carcinogenic or cytochrome also be used to identify a surageaic, carcinogenic or cytochric compound. Cytochrome P450 are a large family of baemprotein enzymes capable of metabolising xemobiotics enchanges carcinogens and environmental pollutants as well as enchabolistics such as steroides, fatty acids and prostaglandins.

a de la composition de

The nucleotide sequence of the CDNA encoding the human cytochrome P450

St species 2C9. The gene encodes a protein of 491 amino acids. The CDNA

vas amplified by PCR using the primers AA087735-8. The product was

Cloned into the yeast expression vectors PAM316 or PAMRR to produce the

vervors p209 for the expression of the cytochrome P450 alone or p209R

Compound by reacting the chemical compound with recombinantly produced

The vectors are used in a method for evaluating the safety of a chemical

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence encodes the human derived cytochrome (HDC) P45029, which was obtd. from a commercial cDNA library. Teast were transfected with an expression vector contg, the HDC cDNA cultured and then disrupted to dive a nicrosomal fraction. The EDC was purified from the fraction, and used to lammulse and sensities a mammal. Blood was drawn from the mammal, and an anti-HDC antibody solated. The antibody obtd. recognises HDC P405029, partic. at a serum dilution rate of 1:10000, and is substantially without cross reaction to other HDC P450 spp.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Autibody recognising human derived cytochrome P4502C9 - allows apecific detection of cytochrome P450 species in humans

                                                                                                                         The present invention describes a fusion proteins comprising a portion of a bacterial cytochrome P400 protein and also a portion of a mammalian cytochrome P400 protein and also a portion of a mammalian cytochrome P400 protein. The fusion protein can oxidise hydrocarbons or any compound having a carbon-hydrogen boad. The fusion protein can be used for hydroxylating a compound to be oxidised. It can also be used in the bloremediation of an environmental pollutent. Since the fusion protein is anoluble, it can be subject to structural elucidation by X-ray expressed in soil bacteria to facilitate bioremediation. The present sequence encodes amamalian cytochrome P400 protein CTP2C9 from the present invention.

The sequences given in AAT11378-81 encode allelic variants of cytochrome 78.0 CF. The following control of clones isolated for 1209.

78 10 CF. The majority of clones isolated for 1209.

70 If the 50 clones encoding 209, only two allelic variants were found.

70 of the 209 clones were identical with clone 50, and il were ledentical 39 control of 100 clones were identical with clone 55, and 140 clone 57.

71 choncoding regions but contained 2 single base changes at positions control of 1075 and 1405. One of these base changes was conservative but the other results in one amino acid difference at position 359, ille to Leu. The clones 20c and 60 differ by one nuclectide in the coding region of control of 154, which results in a single amino acid change. This to Met at position 355. Clone 20c has a very long, 198 bp. 5° noncoding region containing three position 60 clones ignal 21 bases from the poly A tail. Clone 6b has an unusually long 3° noncoding region containing three possible conformation signals with no poly A tail. The differences in the 3° non-coding regions could represent alternate splicing, allelic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated cytochrone P450 2c subfamily member - used for identifying drugs metabolised by 5-mephenytoin 4'-hydroxylase activity and to develop other screening assays

Screening for drugs metabolised by cytochrome P450 - for identifying mutagenic, carcinogenic, or cytotoxic compounds

Example 2; Column 53-56; 63pp; English.

This sequence encodes a human cytochrome P450 2C9 polypeptide isolated from clone 65. This polypeptide is used in a method to screen for a drug that is metabolised by a cytochrome P450 having S-mephenytoin 4'-hydroxylase extivity. The protein can also be used to identify a mategapaic, carcinogenic or cytochac compound. Cytochrome P450 are a large family of hemosprotein enzymes capable of metabolising xenoblotics such as drugs carcinogens and environmental pollutants as well as

Sequences AM51110-AM31193 represent human DNA fragments which contain balallelie markers. The sequences are related to various human genes including microscanal glutathione 5-transferase II (MGSTI1), malate decarboxylase enzyme (DMEI/MEI), cytochrome P450, glutathione p460, edutathione genes genes graph graphase (GSMEI/MEI), cytochrome p450, glutathione p450, glutathione p450, glutathione p450, glutathione p450, glutathione p450, glutathione gamma-glutamyltransferase 5 (GGTS), dipeptidase (DP), glutose 6-phosphate Polynucleotides comprising sequences from malate decarboxylase enzyme-related biallelic markers used for genotyping . Blumenfeld M, Bougueleret L, Chumakov I, Cohen-Akenine A; Claim 13; Page 283; 673pp; English.

debydrogenase (G6DBL), phosphogluconate dehydrogenase (PGDB), and uridine diphosphate glucoronosyl transferases (UGT2). Each of these sequences contains a biallelic marker/polymorphism, which is represented in the sequence as a degementate/undefined base. The genes to which the bialloic marker containing sequences are related are involved in drug metabolism. Sequences AMB15184 - AMB15189 represent the qenomic sequence of the fact of the fact of the septiment of the sequence of the marker containing sequences are related are involved in drug metabolism. Sequences AMB15184 - AMB15189 represent the qenomic sequence of the metabolism command of the sequence of the set of the amplification of human genomic DNA sequences. AMB1980 and AMB1809 of the used to make used in a molecular a method of genotyping comprising determining the involution of marker in a biological sample. The method is used to determine the frequency in computation of an allele of a DNE or MOST-II related biallelic marker and to select an individual for inclusion in a clinical trial of a drug content of the section of the section between haplotype and phenotype.

Createment The method is also used to detect association between haplotype and phenotype or allele specific amplification assays. Sequencing assays or allele specific amplification assays. The method casted to select an individual suffers or is at risk of developing negation.

This invention describes a recombinant cytochrome P450 protein which is purified from a host cell culture using a combination of detergents and enzyme inhibitors. The method comprises (a) fractionating the host cells to prepare their membranes, (b) adding a non-ionic detergent to the membranes, (b) adding a non-ionic detergent to the membranes in a concentration of 0.8 % to 2% (w/v) in a cetergent to the membranes in a concentration of 0.8 % to 2% (w/v) in a detergent to the membranes in a concentration of 0.4% to 0.8% (w/v) in a cetergent to the membranes in a concentration of 0.4% to 0.8% (w/v) in a purifying the protein ratio of between 2:1 to 4:1 (d) centrifying the protein through a diethylaminoethyl-beaded column, then through a carboxymethyl-beaded column, and finally through a carboxymethyl-beaded particles. The method simplifies the carboxymethor of P450 proteins which are responsable for catalyshing the oxidation of P450 proteins, by the use of improved expression vectors and novel detergent combinations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytochrome P450; detergent; enzyme inhibitor; non-ionic; ionic; purification; drug oxidation; steroid; carcinogen; pesticide; human; ss

Purifying recombinant cytochrome P450 · by utilising novel combinations of detergents and enzyme inhibitors

Disclosure; Column 53-54; 91pp; English.

This invention describes a recombinant cytochrome P450 protein which is purified from a host cell culture using a combination of detergents and engrge inhibitors. The method comprises (a) fractionating the host cells to prepare their membranes, (b) adding a non-ionic detergent to the membranes, (b) adding a non-ionic detergent to the membranes in a concentration of 0.8% to 2% (w/w) in a cetergent introduce in a concentration of 0.8% to 2% (w/w) in a cetergent protein ratio of between 4:1 to 10:1, (c) adding an ionic detergent protein ratio of between 2:1 to 4:1 (d) centrifuging the membrane-detergent mixture to remove insoluble materials and (e) purify trying the protein through a deterphalmicochyl-beaded column, then culturing the protein through a deterpentyl-beaded column, and finally through as chiptorylapatite column, the method is used to purify cyclochrome P450 cortection, which are responsible for catalysing the oxidation of e450 certains, which are responsible for catalysing the oxidation of e450 proteins, by the use of improved expression vectors and novel detergent combinations.
